Predictors of In-School and Post-School Success

Recently, the National Secondary Transition Technical Assistance Center (NSTTAC) conducted a systematic literature review to identify in-school predictors of post-school success in the areas of employment, education, and independent living for secondary students with disabilities (Test, Mazzotti, Mustian, Fowler, Kortering, & Kohler, 2009). As a result of this literature review, NSTTAC has identified 16 evidence-based predictors of post-school employment, education, and independent living success from the correlational research including career awareness, community experiences, exit exam requirements/high school diploma status, inclusion in general education, interagency collaboration, occupational courses, paid employment/work experience, parental involvement, program of study, self-advocacy/self-determination, self-care/independent living skills, social skills, student support, transition program, vocational education, and work study.

As NSTTAC has been disseminating these findings, we have had requests to gather a comprehensive list of predictors of in-school and post-school success for all secondary students. In an effort to respond to this request, NSTTAC has begun to develop a comprehensive list of predictors of in-school and post-school success across students with disabilities, students without disabilities, students at-risk, and students with mental health issues. To do this, NSTTAC reviewed reports and documents from various sources, including the National High School Center, Center for the School of the Future, National Dropout Prevention Center, Manpower Demonstration Research Corporation, Center for Research on the Education of Students Placed At Risk, and National Network on Youth Transition for Behavioral Health.

To be included reports and documents had to meet the following criteria: (a) included secondary education for students with and/or without disabilities, students at-risk, and/or students with mental health issues and (b) provided information or data on secondary in-school program variables as predictors of in-school and post-school success supported by research. Reports and documents were excluded from analysis if they did not supply empirical references and did not discuss secondary variables as predictors of in-school and post-school success.

From the reports/documents, NSTTAC has developed an initial draft of the following table, which provides information about in-school predictors of in-school and post-school success for students with disabilities, students without disabilities, students at-risk, and students with mental health issues. At this point, we are asking for your assistance. Please review the following tables and provide any feedback or additional information or references that you feel needs to be included. Please send your feedback to David W. Test at dwtest@uncc.edu.
## Predictors of In-School Success

<tr>
<td></td>
<td>week high school engineering curriculum, were more likely to attain high ACT math scores. Students who participated in PLTW, an 8 week high school engineering curriculum, were more likely to complete approximately the same amount of math and science credits in high school. Students who participated in PLTW, an 8 week high school engineering curriculum, were more likely to be involved in career exploration, including talking with adults about career goals and participating in school experiences that help them clearly define career goals. Students (i.e., seniors) who participated in PLTW, an 8 week high school engineering curriculum, were more likely to have higher attendance rates during the senior year than non-PLTW seniors. Students (i.e., seniors) who participated in PLTW, an 8 week high school engineering curriculum, were more likely to complete math courses during the senior year. Students who participated in PLTW, an 8 week high school engineering curriculum, were more likely to score higher on 10th grade state assessment in math and reading.</td>

| 1. Inclusion in General Education¹ | - Students who participated in regular academics were 5 times more likely to participate in postsecondary education  
- Students who took academic courses in regular education placements were more likely to be engaged in post-school education, employment, and independent living ¹  
- Students with high performance in five areas, including reading, writing, math, behaving responsibly, and problem solving skills were more likely to be engaged in postsecondary education ¹  
- Students who passed more than half or all courses in 8 curriculum areas (remedial education) were more likely to be engaged in postsecondary education ¹ | Education                    | Employment                  | Independent Living       |                   |                                   | (Baer et al., 2003)¹                                                                                                                  | (Blackorby et al., 1993)¹                                                                 | (Halpern et al., 1995)¹                                                                 |
academics, traditional content classes, personal finance, community access, behaving responsibly, goal-setting or problem solving, specialized vocational education, regular vocational education) were more likely to be engaged in postsecondary education.

- Students who had high scores on adaptive and academic skills, self-care skills, GPA on academic activities, received a diploma, and higher IQs as reported in school records were more likely to live independently.

- Students who took more hours of academic and occupational courses and spent more time in regular education were more likely to be engaged in post-school employment.

- Students who participated in more highly integrated and less highly specialized school programs were more likely to be living independently (i.e., high independence defined as: (a) parent’s prediction of youth’s future home independence, sum of cooking, shopping, washing, and cleaning skills, (b) sum of phone, time-keeping, counting, reading skills; (c) sum of dressing, feeding, and going out skills; (d) respondent’s claim of youth’s ability to respond on a follow-up questionnaire).

- Students who spent more hours in regular education courses were more likely to be living independently (i.e., high independence, high esteem, minimal (i.e., high independence defined as: (a) parent’s prediction of youth’s future home independence, sum of cooking, shopping, washing, and cleaning skills, (b) sum of phone, time-keeping, counting, reading skills; (c) sum of dressing, feeding, and going out skills; (d) respondent’s claim of youth’s ability to respond on a follow-up questionnaire; high esteem defined as: (a) respondent’s or

school's claim of therapeutic counseling for youth; (b) number of developmental disabilities services attributed to the youth; (c) youth used some developmental disabilities prosthetic device in the past year; (d) youth worked for pay in the past year; (e) youth worked with or without pay in the past year; (f) educational status, dropout to college graduation)

- Students who were integrated into a regular school setting for most of their schooling were more likely to be engaged in post-school employment
- Students who had the highest degree of integration with age-appropriate peers were more likely to engage in post-school employment
- Higher performance scaled to the National Assessment of Educational Progress (NAEP) in mathematics was positively correlated with enrollment in postsecondary education, selectivity of postsecondary institutions that students attend, and the likelihood that the students receive a bachelor’s degree
- Students, including those with low achievement levels, who take more rigorous, academically intense programs in high school are more likely to enroll and persist in post-school education
- Students who participated in mainstream academics were more likely to choose postsecondary education goals.

5. (Daviso, Denney, Baer, & Flexer, 2011)
6. (Harvey, 2002)
7. (Heal & Rusch, 1994; 1995)
engaged in post-school employment

- Students who graduated with a diploma (versus a certificate) were more likely to be engaged in post-school employment
- *Students who had high GPA at graduation were more likely to have high GPA in post-school education* (Rabren et al., 2002) (DaDeppo, 2009)

3. Program of Study

- Students who participated in school-based programs that included career major ("sequence of courses based on occupational goal"), cooperative education ("combines academic and vocational studies with a job in a related field"), school-sponsored enterprise ("involves the production of goods or services by students for sale to or use by others") and technical preparation ("a planned program of study with a defined career focus that links secondary and post-secondary education") were 1.2 times more likely to be engaged in post-school employment (Shandra & Hogan, 2008)

4. Transition Program

- Students who participated in the Youth Transition Program (Oregon) with 4+ transition goals met were more likely to be engaged in post-school employment or education
- Students who received transition planning services (compared to those who did not) during the year prior to leaving school were more likely to be engaged in post-school education
- Transition service characteristics (i.e., Assoc. of Retarded Citizens, Department of Children and Families, Developmental Services, Division of Blind Services, DVR Rehab, Easter Seal, Job Service of FL, Job Training, Mental Health, Social Security Initiatives, United Cerebral Palsy) were significantly positively correlated with the rate of exiters found in postsecondary education (Benz et al., 2000) (Halpern et al., 1995) (Repetto et al., 2002)
Transition support characteristics (i.e., Agency Referral FU, Case Management, Community Services; Employment Spec., Equipment, Family Services, Financial, Guardianship, Guidance/Counseling, Living Arrangement, Medical, Parent Information, Referral, Social/Leisure, Support Service, Teacher Resources, Transition Spec., Transportation) were significantly positively correlated with the rate of exiters found in postsecondary education.

Transition program characteristics (i.e., academic, adult ed. Career education, college, community training, course mod., developmental train., employment, entrepreneurship, follow-up services, goodwill, job coach, job corp, life skills, military, vocational training, voc eval/assess) were significantly positively correlated with the rate of exiters found in postsecondary education.

Students with EBD, who received TIP-based transition services, were more than three times more likely than youth with EBD, who did not receive TIP services, to be engaged in post-school education.

Students who participated in the Transition Service Integration Model were more likely to be engaged in post-school employment.

Students who participated in transition programs that included student involvement in the IEP, skill development, and opportunities for self-advocacy and self-determination, postsecondary education preparation, independent living preparation, and career preparation had higher postsecondary self-determination skills as measured by the Psychological Empowerment subscale of the ARC’s Self-Determination Scale (Wehmeyer & Kelchner, 1995), the How I feel About Myself Scale (Karpur, Clark, Caproni, & Sterner, 2005), and (Certo et al., 2005) (Morningstar et al., 2010).
(Rehfeldt, 2006), and the Adult Trait Hope Scale (Snyder et al., 1991)

5. Occupational Courses
- Students who passed more than half or all courses in 8 curriculum areas (remedial academics, traditional content classes, personal finance, community access, behaving responsibly, goal-setting or problem solving, specialized vocational education, regular vocational education) were more likely to be engaged in postsecondary education
- Students who participated successfully in Occupational Skills Training (OST) program services which included characteristics: individualized design, work-site based curriculum, and a focus on the existing labor market and employment, were more likely to higher wages and worked more hours per quarter.

6. Paid Work Experience
- Students who participated in the Youth Transition Program (Oregon) with 2 or more paid jobs during high school were more likely to be engaged in post-school employment or education
- Students in the School to Work Transition Program (Oregon) who had 2 or more jobs during the last two years of high school were more likely to be engaged in post-school employment
- Students who had worked for pay during high school for a full year were more likely to be living independently
- Students with two or more jobs during their last two years of high school were more likely to be engaged in post-school employment
- Students who had a job at the time of high school exit were 5.1 times more likely to be
7. **Vocational Education**

- Students who participated in vocational education were 2 times more likely to be engaged in full-time employment
- Students who passed more than half or all courses in 8 curriculum areas (remedial academics, traditional content classes, personal finance, community access, behaving responsibly, goal-setting or problem solving, specialized vocational education, regular vocational education) were more likely to be engaged in postsecondary education.
- Students with vocational education credits in high school (versus those with none) were more likely to be engaged in post-school employment and post-school education.
- Students who received technology training were more than twice as likely to be employed than those who did not receive technology training.
- Vocational courses (CTE) improved later earnings for those students who enrolled in postsecondary education or training.

8. **Work Study**

- Participation in work study increased the likelihood of full-time employment more than two times.
- Students in the Bridges School to Work Program who completed the internship were more likely to accept a post-school job offer.
- Students who participated in the Bridges program in their last year of high school and

### 14. Parental Involvement

- Students with one or more parents who participated (as measured by the percentage) in more IEP meetings during the 11th and 12th grade year were more likely to be engaged in post-school employment[^1]
- Students with positive perceptions of their parents’ involvement in the IEP meeting (e.g., active participants, provided some input, attended meetings but did not actively participate) had higher postsecondary self-determination skills as measured by the Psychological Empowerment subscale of the ARC’s Self-Determination Scale (Wehmeyer & Kelchner, 1995), the How I feel About Myself Scale (Rehfeldt, 2006), and the Adult Trait Hope Scale (Snyder et al., 1991)^[^13]
- Students with positive perceptions of activities parents involved them in to prepare them for postsecondary education had higher postsecondary self-determination skills as measured by the Psychological Empowerment subscale of the ARC’s Self-Determination Scale (Wehmeyer & Kelchner, 1995), the How I feel About Myself Scale (Rehfeldt, 2006), and the Adult Trait Hope Scale (Snyder et al., 1991)^[^13]
- Students with positive perceptions of career skills parents taught them had greater postsecondary self-determination skills

1. Students with parent expectations of employment were more likely to have employment after high school.¹
2. Students with visual impairment who had support from parents were more likely to engage in post-school employment in early adulthood.¹

15. Student Support¹
- Students who had support from self-family-friend network to find a job were more likely to be engaged in post-school employment.¹
- Students who indicated high levels of satisfaction with instruction received (reading, writing, math, behaving responsibly, and problem solving) during high school were more likely to be engaged in post-school education.¹
- Students who spent more time per week with friends during school were more likely to experience higher quality of life (independent living).¹
- Students with high occupational guidance and preparation (based on teacher student ratings from the Life Centered Career Education rating scales) were more likely to have higher quality of life (independent living) and be engaged in post-school employment.¹
- Student who had support from informal (family/friends) or formal (vocational rehabilitation service) were more likely to work in community-based work settings.

16. Interagency Collaboration¹
- Students who received assistance from 3 to 6 community-based agencies (as compared
